                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                encoding a cytocoxin such as saporin. One or more linkers may join the CR FGFR-binding protein to the nucleic acid binding protein. These are selected to increase the specificity, toxicity, solubility, serum CR stability or intracellular availability, and may serve to promote condensation of nucleic acids for delivery to a cell. The fusion protein binds to FGFR and is internalised by cells that carry this receptor. The curry this receptor. The function, gene expression and viability of cells. In particular, it may composition is used for the therapeutic alteration of the function, gene expression and viability of cells. In particular, it may composite the treatment and prevention of cell proliferative disorders, correction, gene expression and represention of cell proliferative disorders, correction are the treatment and prevention of cell proliferative disorders, cretinopathy, psyllasis and eczema. The gene delivery compositions of the invention have high specificity for particular cells and can deliver carry to the proteins of the carry (VEGF), and sequences v90402-v90405 represent the encoded very proteins. Al2857 represents cDNA encoding human heparin-binding epidermal growth factor (HBEGF) precursor, and v90406-v90409 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel gene delivery composition for the targetted delivery of cytotoxins or prodrug-converting enzymes to proliferating cells. The gene delivery composition comprises a protein that binds the fibroblast growth factor receptor (FGFR) which is fused chemically conjugated to a nucleic acid binding domain. The nucleic acid binding domain is complexed with a suitable expression construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gene delivery system, useful for treating or preventing cancer and rheumatoid arthritis, comprises receptor-internalized ligand linked
                                                                                                                                                                                                                                                                                                                                                                                         03-JUL-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Y69412 standard; Protein; 147 AA.

                                                                                                                                                                                                                                                          The present sequence represents native human vascular endothelial growth CC factor (VEGF) 121. VEGF is an angiogenic factor. VEGF proteins are used for the prevention or repair of injury to blood vessels or associated convascular tissues (served by the blood vessels) and for the prevention croangiopathy. The proteins methods may also comparticularly thrombotic microangiopathy. The proteins methods may also comparticularly the prevention and treatment of kidney diseases associated with injury to, or atrophy of, the vasculature of the glomerilus and comparticularly the prevention and treatment of kidney diseases associated interstitium. Conditions which may be treated include haemolytic uremic comparticularly treated include haemolytic uremic computations which may be treated include haemolytic uremic compression, thrombotic thrombocytopenia purpura, disseminated intraction, ischemic bowel disease, transient ischemic composation injury, acute respiratory distress syndrome, toxic alveolar conjury, pneumonia, pulmonary emboli, birth prematurity disorders, companies, hypersensitivity, autoimmune diseases, organ transplants, focal glomerulosclerosis, and amyloidosis.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

acidic fibroblast growth factor 1 - rat
N;Alternate names: heparin-binding growth factor 1
C;Species: Ratus norvegicus (Norway rat)
C;Date: 28-Feb-1990 #sequence_revision 28-Feb-1990
C;Accession: S04147
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acidic fibroblast growth factor - golden hamster

RT mMr 25,000 heparin-binding protein from guinea pig brain is a high RT molecular weight form of basic fibroblast growth factor.";

RT mCC. Natl. Acad. Sci. U.S.A. 84:5778-5782(1987).

CC. -!- FUNCTION: WIDE-SPECTRUM MITOGENIC, ANGIOGENIC, AND NEUROTROPHIC CC FACTOR. IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC CC PROCESSES, INCLUDING LIMB DEVELOPMENT, ANGIOGENSIS, WOUND HEALING, AND TUMOR GROWTH. POTENT MITOGEN AND CHEMOATTRACTANT FOR CC MESENCHYME-DERIVED CELLS. IMPLICATED IN THE DIFFERENTIATION, PROLIFERATION, AND MAINTENANCE OF CELLS IN THE CENTRAL NERVOUS CC SYSTEM AND IN BONE FORMATION. MAJOR ANGIOGENIC FACTOR THAT ALSO CC STUDYNTI FORMS A QUATERNARY COMPLEX WITH TWO FGFRI AND AT LEAST CC ONE HEPARAN SULFATE (BY SIMILARITY).

CC -!- ALTERNATIVE PRODUCTS: AT LEAST TWO ISOFORMS; 18 KDA AND 25 KDA CLIFENATION SITES. BOTH FORMS ARE ACTIVE.

CC -!- FUM. THE N-TERMINAL OF ISOFORM ARE ACTIVE.

CC -!- FUM. THEN TERMINAL OF ISOFORM ARE ACTIVE.

CC -!- SIMILARITY: BELONGS TO THE HEPARIN-BINDING GROWTH FACTORS FAMILY.

CC -!- FUM. THEN THE HUMAN SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY TO THE HUMAN SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY TO THE HUMAN SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY TO THE HUMAN SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY ALANGS-ACID SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY ALANGS-ACID SEQUENCE AS WELL AS ON THE BASIS OF SIMILARITY ALANGS-394.1; ALT_FRAME.
